# Our Earth

**Directions:** The Earth is a sphere made of rock and magma. There are four layers. Read the descriptions of each layer, and write the correct name.

This layer makes up two-thirds of the Earth's mass and is about 1,800 miles deep. It is made up of a thick, solid, rocky substance, with portions that melt enough to flow.

\_\_\_\_\_

Surprisingly, this layer is thought to be solid, even though it is furthest from the surface and beneath what's thought to be molten lava.

\_\_\_\_\_

This layer of the Earth is hard and composed of different minerals. It is the thinnest layer.

\_\_\_\_\_

At a depth of 3000 miles beneath the surface, this layer is believed to be made of super-heated liquid molten lava. This lava is thought to be made of mostly iron and nickel.
